

A Design Process

Think about problems that you want to solve or things you want to fix or make better.

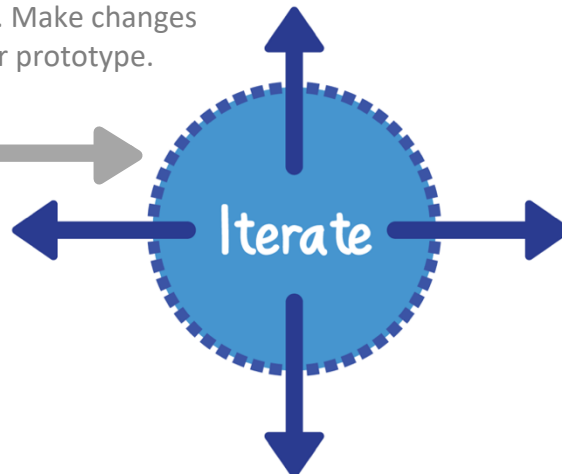

Choose a problem that you care about the most. Think of ways you could solve it. Draw a diagram with labels or make a list.

Iterate means make it better. Make changes to your prototype.

Test your prototype or talk with someone else about how it works. Is it working the way you thought it would?

Build a model, or prototype, of your idea. Use materials around the house and show how it would work.
